

UFO Type Propulsion Systems on the Human Horizon

Thanks to a fresh interpretation of our universe the same types of systems that propel UFOs through space may be developed on Earth in the near future.

Controlled field propulsion systems may sound like science fiction to some but are seen as an inevitable, near future reality by others.

Controlled field propulsion is the understanding of and the ability to manipulate the same field that causes gravity, in order to move a vehicle through space, and it may not be as difficult as it may seem at first glance.

It is not a question of “if” field propulsion is possible, we see and feel field propulsion everyday as gravity propels us toward the Earth, as magnets are propelled toward iron objects, and as we tend to keep moving in straight lines as our cars go around curves. It is simply a matter of when we will learn to manipulate the “field” of inertia and gravitational and magnetic fields.

Michael Jones, author of *Logical Universe* explains that our common way of thinking about gravity is wrong and has offered \$15,000.00 to the first person to prove that gravity is due to objects pulling on one another.

“The current belief that gravity is due to objects pulling on one another is as ungrounded and outrageous as the archaic belief that the sun revolved around a flat Earth”.

There is a direct link that exists between inertia, gravity and the propagation of light that shows us that the fabric of the universe is dynamic and that light is our visual indicator of its motion.

Gravity is not caused by objects pulling on one another but by the fabric of the universe pushing them toward one another.

By understanding that acceleration due to gravity is only the result of an imbalance between the fabric of the universe acting upon an object from opposite directions, and is not dependent upon a massive body in the vicinity, we may be able to develop mechanical and electromagnetic means of generating artificial gravitational fields.

Controlled field propulsion will be the result of a good theory, hard work and dedication, much like that required of the Wright Brothers for heavier than air flight.

Jones is studying controlled field propulsion, and, using the concept of the dynamic fabric of the universe, hopes to develop a controllable system in the near future.

Michael F. Jones – Author, *Logical Universe*
